## **Introduction**

On December 18,2025 TS.HJ.Abdul Alim Bin Abdul Muttalib who is an alumni of UTM and Head of Technology and Innovation of Serunai Commerce Sdn Bhd delivered Industry Talk 2 covering project management and system development at Hyflex Classroom,N28A.

## **Project Management and System Development**

Project management is a process of planning, managing and controlling a project from start to end,including time planning, source, scope and the risk of the project which are essential for developers.System development is where developers build systems gradually and systematically via SDLC (Software Development Life Cycle) phase which is planning, analysis, design, implementation and maintenance. The speaker used cooking nasi lemak to explain technical concepts where by practicing daily,students can grasp the concept easily.For students,these skills help to manage time,prevent drastic scope changes and produce stable systems with easy maintenance.With that, students can connect theoretical knowledge to real industry world needs.

## **Waterfall and Agile Methodologies**

Waterfall methodology is a linear, structured approach to project management. It follows the steps of gathering requirements, design, implementation, verification and maintenance.Due to its structures,changes are hard once the project starts. Meanwhile, Agile uses an iterative approach to project management where Agile is more flexible and adaptive to any changes.Most companies adopt Agile due to its adaptability. In data engineering, this means being adjustable to requirements, data sources, and emerging technologies. For example, a data engineering team works on a project to build a data warehouse for a finance company.As project progresses, the company decides to expand its data sources to include macroeconomic data.So,the team quickly integrates the new data source into the pipeline, ensuring the project remains relevant.

## **Implementation of AI Tools in our Career**

Despite misuse of AI, our speaker advises using AI tools for projects.His success formula is 40% AI leverage and 60% of project management and system development skills. *AI coding assistants became game-changers this year, but harnessing them effectively takes skill and structure.* (Osmani,2025).Thus, AI tools assist,not replace developers to build and manage system development even faster with tight deadlines.However,the speaker emphasized that employers

prioritize candidates skilled in system architecture and AI-assisted productivity as job competition rises due to AI advancements.

**Reflection :** As for me, this industry talk gave me a clear explanation about project management and system development. I also learned that the agile method is more effective because we can continuously improve the system by continuously receiving feedback from the user time by time. In the next four years, I must strengthen my understanding in project management skills by applying agile methodology in projects and assignments. I also have to master soft skills like communication skills. This will help me to become more prepared and enhance my skills for real industry challenges. —by Nor Ain Fahira binti Muhamad Fariq

**Reflection:** The talk highlights the importance of project management and system development, favoring the use Agile method rather than Waterfall method as Agile is more flexible in handling problems. The talk also clarified to use AI to boost efficiency, not misuse them. In 4 year times, I will focus on sharpening my coding skills and improve my soft skills and leverage AI tools to stand out in the competitive job market. —Qistina Batrisyia Binti Noor Mohd Azlan)

**Reflection :** Overall, I really enjoyed this industry talk session as the speaker Ts. Hj. Abdul Alim explained about project management and system development using simple analogies such as cooking that helped me understand better and gave me a deeper insight. I also love the way he actively engages with us which made the whole talk session interesting. In the next 4 years, I aim to graduate with strong technical and soft skills, ready to tackle challenges in the real world industry. — by Mursyidah binti Jahidi
