COMPANY BACKGROUND

Johor Corporation (JCorp) is a state-owned investment management company founded in 1968 and headquarters in Johor Bahru, Malaysia. It owned by the Johor State Government and operates multi-sector organisation including agribusiness, wellness and healthcare, food and restaurant service, real estate and infrastructure, foundation and waqf.

JCorp contributes in providing a platform which improves the quality and socioeconomic status of the community, in line with their mission of Membina & Membela. JCorp has a significant role in the development of industrial ecosystem that help Johor-based companies in growing and connect with international markets, support with infrastructure and collaborative platforms.

INDUSTRY VISIT TO JOHOR CORPORATION

An industry visit to Johor Corporation (JCorp) was organised to provide students with new knowledge and practical exposure to real working environments and the implementation of digital systems in corporate organisations. The visit was held on 7 January 2026 at Menara Komtar, Johor Bahru City Centre.

This industry visit was part of the Technology & Information System course under the Bachelor of Computer Science (Data Engineering) programme, aimed to enhance students' understanding of how academic knowledge learned in the university is applied in actual industry by introducing the requirements, preparation and relevant skills needed in the professional practice.

OBJECTIVES

Students gain direct exposure to JCorp's digital transformation implementation, mainly in adopting AI, automation and data-based approaches in advancing business operations. Additionally, an understanding of the role of computer-assisted systems in JCorp, including IT service systems, AI tools and cloud platforms. Another objective is to provide students with insight into integration of computing, networking, and data technologies in real corporate environment.

KEY OBSERVATION & TECHNICAL INSIGHTS

07 January 2026

USE OF DATABASE & SYSTEM

The edge data is planned to be converted by JCORP into business outcomes, making the invisible visible via centralized network architecture model with enhanced security, which is the Secure Access Service Edge (SASE) Security Platform while also simplifying operations.

JCORP AI Gen-BI and multi-LLM strategy, along with Machine Learning Operations (ML-Ops), are established to enable more efficient, continuous build-scale-deploy system at JCORP. Data lifecycle management, policies, and governance are implemented by ML-Ops to drive operations and machine building. The continuous build-scale-deploy and data-perception-based prediction are taken advantaged by the multi-LLM strategy.

Comprehensive operational control is aimed to be gained by JCORP through the 8 elements in its Command Centre, it being the AI & Analytics, real-time data integration, interactive intelligence dashboards, security surveillance, predictive analysis, communication and collaboration, automation system and business intelligence platform.

ENTERPRISE SYSTEMS

An enterprise system is referred to as a large scale, integrated software solution that supports core business processes and functions across an entire organization.

An enterprise system is established by JCORP, utilizing AI, automation, and analytics to harness value from the empowerment of people, processes, and innovation, thereby increasing the business values and achieving an exponential organization through digital empowerment.

JCORP's enterprise system has progressed as an entity, rooting from 2020 with the cloud-first strategy through the end of 2025 with JCORP AI LLM development and its own command centre, expected to be completed and implemented by April 2026.

The RITE Framework and core AI capacity, consisting of 3 layers; foundation layer, MLOps & orchestration, and application layer are introduced into a remodelled JCORP as an AI-First investment holding company, further boosting company performance and speed of progress of JCORP.

ROLE OF COMPUTING & INFORMATION SYSTEM

TYPE OF COMPUTER SYSTEM

A computer system is referred to as a complete functional setup combining hardware and software, working together to process data, store information and perform tasks, ranging from a single device to large networks.

Specifically in JCORP, personal computers, server computers and digital computers are used. These computers are fully equipped with essential software such as Microsoft Office 365, Microsoft Azure, AWS, SAP and many more for the purpose of cloud computing and enterprise apps.

LEARNING OUTCOMES, REFLECTIONS & CONCLUSION

07 January 2026

CONCLUSION

In conclusion, the industry visit to Johor Corporation was a valuable learning experience for students. It helped students connect theoretical knowledge with real-world applications. The visit also increased students' understanding of how digital transformation supports large organisations. Overall, the visit was beneficial in preparing students for future academic and career development.

ACKNOWLEDGEMENT

The author would like to thank Johor Corporation (JCorp) for allowing students to visit their organisation and share valuable knowledge and experience. Appreciation is also extended to the lecturers and organisers who made this industry visit possible.

KEY LEARNING OUTCOMES

From the industry visit to Johor Corporation (JCorp), students learned how digital systems are used in a real corporate environment. The visit helped students understand how technologies such as artificial intelligence (AI), automation, cloud computing, and data systems support daily business operations. Students also gained a clearer understanding of enterprise systems, data management, and how a command centre is used to monitor and support decision making.

SKILLS AND KNOWLEDGE DEVELOPMENT

This visit helped students improve their technical knowledge, especially in enterprise systems, cloud platforms, AI tools, and data-driven systems. Students learned how data is managed, analysed, and used to improve business performance. Besides technical knowledge, students also developed soft skills such as communication, observation, and the ability to relate what is learned in class to real industry practices.

RELEVANCE TO ACADEMIC STUDIES AND CAREER

The industry visit is closely related to students' academic studies, especially for those in the Bachelor of Computer Science (Data Engineering) programme. Topics learned in courses such as Technology & Information Systems, databases, cloud computing, and artificial intelligence were applied directly at JCorp. This visit also gave students early exposure to industry working environments and helped them understand the skills and knowledge needed for future careers in the IT and data-related fields.
